

ServiceNow Script-Controlled ACL Project

Module 7 – End-to-End Testing Matrix

Lab duration: 3 hours | Development/Training Instance

Objective

Validate the complete ACL design by progressively assigning roles and testing each operation.

Test Matrix

Use the following test stages:

1. **bb1 only**: READ is tested; New/Edit/Delete should not be available unless other ACLs permit them.
2. **bb1 + bb2**: READ + CREATE.
3. **bb1 + bb2 + bb3**: READ + CREATE + WRITE.
4. **bb1 + bb2 + bb3 + bb4**: READ + CREATE + WRITE + DELETE.
5. **No bb1**: verify the protected READ path is denied for the user.
6. **Admin**: verify administrator access is retained as intended.

Troubleshooting

If an action is missing, check the relevant operation ACL, role assignment, table ACL hierarchy, inherited ACLs, conditions, and whether the session needs to be refreshed after role changes. Use impersonation only in a safe development instance.

Important ACL Concept

Each operation is evaluated separately. A CREATE ACL does not replace READ permission, and a WRITE or DELETE ACL does not automatically grant visibility of records.
