

ServiceNow Script-Controlled ACL Project

Module 8 – Final Outcome and Documentation

Lab duration: 3 hours | Development/Training Instance

Objective

Document the completed Script-Controlled ACL project and the security model implemented.

Final Architecture

Table: u_institution_details

Roles: bb1 = Read, bb2 = Create, bb3 = Write, bb4 = Delete

READ: record ACL with Branch = EEE condition and script-controlled role/admin logic

CREATE: bb2

WRITE: bb3

DELETE: bb4

Administrator: full access through the scripted READ exception and normal administrative permissions.

Learning Outcome

By completing the project, learners understand how ServiceNow ACLs evaluate roles, conditions and scripts; how operation-specific ACLs protect records; and how record-level restrictions can be tested through forms and lists.

Final Checklist

- EEE User created
- bb1–bb4 created
- Roles assigned and tested
- Institution Details table created
- Required fields created
- EEE/ECE/CSE records created
- READ ACL tested
- CREATE ACL tested
- WRITE ACL tested
- DELETE ACL tested
- Admin access verified
- Unauthorized access verified
- Results documented

Note

Perform this lab in a non-production ServiceNow development/training instance. ACL changes can affect data visibility and user operations.
